

Submersible Jet Aerator

WASTEX

WASTEX

JTXSubmersible jet aerator

Features

§ High efficiency oxygen dissolving

It has unique design for gas mixture chamber whose intake air quantity is big. Air can be mixed well with water, and it can produce minute and plenty of air bubble with high air dissolving rate.

§ Intensive mixing

The pressure produced by impeller through jet hole produces forceful water flow, which realizes jet after mixed with air to make oxygen move efficiently in water and at the same time achieve good mixing effect, which can maintain the flow rate necessary for activated sludge floating.

§ Quiet and noise-free

The machine unit is designed to run in water with low winding number and low noise: overland air-intake duct can be additionally equipped with silencing equipment. Cost can be reduced since no other anechoic room is required.

§ Easy for installation and maintenance

There are two types for your selection: equipped with or without automatic attach device. Easy for installation and maintenance, saving operation cost.

§ Wide range of service

It is widely used in industrial wastewater treatment, effluent treatment of livestock husbandry and general foul sewer aeration engineering, aeration tank of effluent facilities of factory applied with activated sludge method. It can be used either individually or in a combined way.

§ Constructive specification

This submersible jet aerator adopts specially designed aeration pump, which forms the integral unit with air bubble generating section and automatic attach device.

§ Special aeration pump

Special aeration pump uses high-performance impeller, which does not block flocs. Therefore, it has long service life.

§ Air bubble generating section

This section is composed of air-inlet duct, nozzle holder, gas mixture chamber and divergent pipe. Water is pumped into gas mixture chamber at high speed from nozzle holder connected to pump outlet. Air is induced into gas mixture chamber through air-inlet duct and is mixed with water flow, then exhausted through divergent pipe.

§ Automatic attach device

This equipment is composed of induction duct, directing plate, the attach- unit. During maintenance of equipment, the pump can be directly pulled out from water through induction duct along with the attach device.

Construction and material

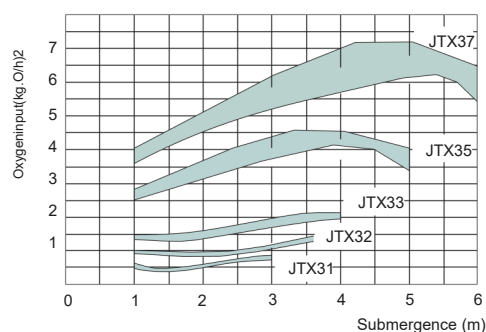

NO.	Name	Material		NO.	Name	Material	
		GB	JIS			GB	JIS
1	Watertight cable			15	Locked spacer	0Cr19Ni9	SUS304
2	Sealing equipment of cable	0Cr19Ni9	SUS304	16	Impeller nut	0Cr19Ni9	SUS304
3	Flying ring			17	Pump casing	HT200	FC200

System flowchart

1. Air-intake duct

Air is taken into the gas mixture chamber through the air intake duct due to the pressure difference between the negative pressure in the gas mixture chamber caused by the high-velocity jet and atmospheric pressure.

2. Gas mixing chamber

After being drawn into the gas mixing chamber, air is compressed into plenty of air bubbles, which are mingled in the water flow forming a gas-liquid compound under the action of hydraulic pressure.

3. Divergent pipe

When the gas-liquid compound is discharged outwards through the divergent pipe, its flow rate will slow down and pressure will rise along with the depth of water so that it can be compressed and ejected efficiently.

4. Gas-liquid compound

Oxygen dissolving efficiency increases due to the fact that there are a large quantity of minute air bubbles in the water; which means the contact area between air and water is large.

5. Pump

This pump adopts a special unblocking type impeller for aeration.
